

I built Palmetto for a friend who I can best describe as a born explorer. Mike likes nothing more than to take a boat up a river or creek as far as possible. The official name of the boat is PALMETTO ROA. ROA stands for Rivers of America which is a series of books by different authors about rivers throughout the United States. Mike must have 20 to 30 of these books in his library, and I have no doubt he will someday have Palmetto up each of these rivers. With all these distant rivers as cruising grounds, he wanted a vessel with the maximum beam which would fit a trailer he could pull with his Ford 250 truck. It was to be shallow draft and have all the amenities of home, but he also wanted to be able to start his journeys from his home port of Astor, Florida. Astor is in central Florida on the St. Johns River. Starting in Astor, he can take a cruise lasting a few weeks up or down the ICW. He wanted a boat which was able to poke along at 7-9 miles an hour but also fast enough to make a 150 mile day to get from Astor to distant cruising grounds in days not weeks. With the twin 200 horsepower Yamaha, Palmetto tops out at 42 miles per hour and cruises very comfortably at 26 mph. This is too fast for me; my style is more to the 7-9 mph. As for the boat design, we started with Sam Devlin Ling Cod 27 foot houseboat cruiser. With the assistance of a contractor's calculator which works with feet and inches, we expanded the station spacing and station molds by 14% which made the boat's dimensions 34 feet LOA, 10 foot beam and 16 inch draft. By using graph paper and a simple method of boat design described in DESIGNING SMALL BOATS by Crocker, we came up with the displacement of 9,700 pounds. With a well-timed article in WOODEN BOAT which describes making a scale model of your design using pennies (one penny equals 10.26 pounds), I was able to work out the trim with all the heavy equipment. The equipment includes two engines at 487 pounds each, a generator at 380 pounds, 180 gallons of fuel at 1,260 pounds, 150 gallons of fresh water at 1,050 pounds, three starter batteries at 240 pounds, and the house batteries at 420 pounds. Did I mention the displacement was only 9,700 pounds? With the model in a bath tub and \$10 worth of pennies from the bank, we were able to lay out everything in the boat and she ended up floating pretty much on her lines. The boat has a cockpit forward and aft for ease and security of handling lines, anchoring, and maneuvering through locks. You walked through the boat with a one step up at both cockpits, a nice feature as you get older! There's a helm station in the aft cockpit with a Bimini for shade and also a station down below with two very comfy helm seats. The layout below is two quarter berths aft, just forward of them is the head on the port side and a stand-alone shower on the starboard. The doors on the head and shower are designed to swing open and close off the hallway so you end up with a large private shower and changing room. Forward of the head shower on the port side is a long counter for the galley which has a under counter side-by-side refrigerator/freezer, countertop oven/ broiler, microwave, and induction cooktop. All appliances are electric which runs off the generator, but can be run by the 3000 watt inverter for short periods of time. Starboard is the dinette table which can be lowered to make a bunk. Under the forward seat is a six gallon electric water heater and under the aft seat is a 16000 BTU reverse cycle air conditioner and heater, both run off the generator. Forward of the dinette/galley are the two helm seats. As I sit here in North Carolina, it is cool and rainy and Mike and his wife are off on a week plus cruise heading for one of his favorite cruising grounds...the isolated barrier islands off the Georgia coast .
